

B2 PayEX

one-stop shop automated payment execution solution

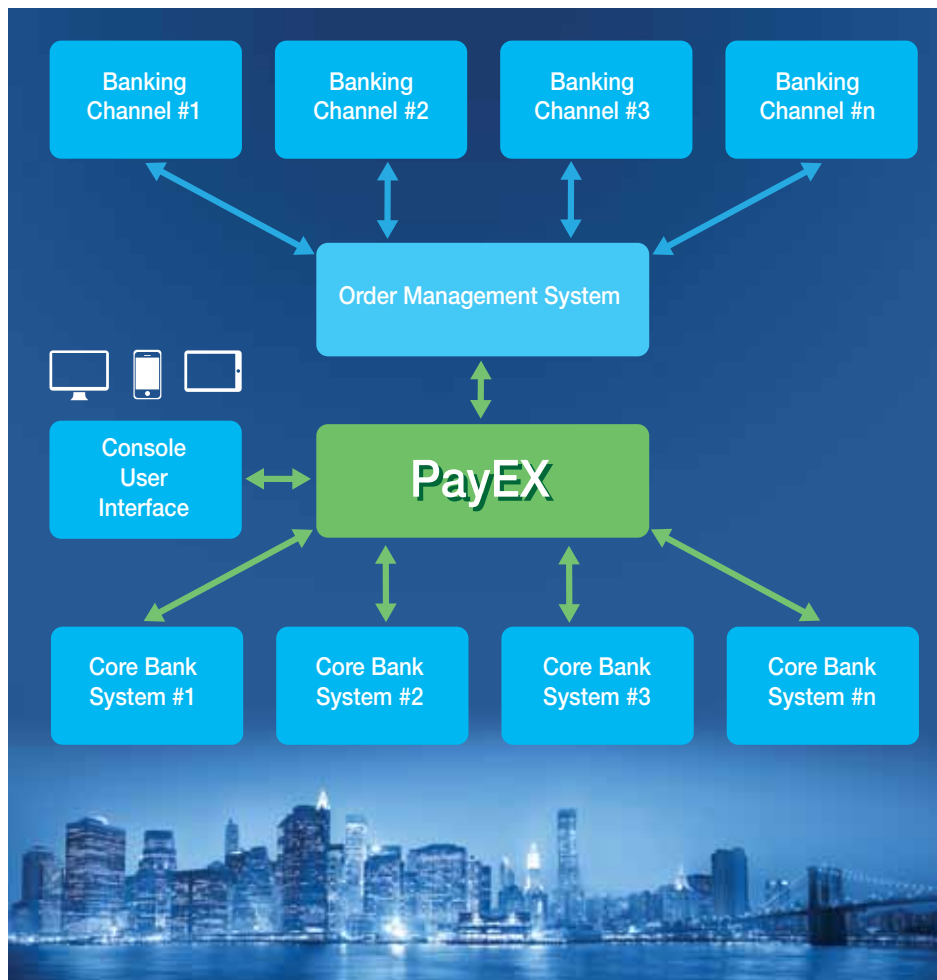

PayEX our one-stop shop automated payments execution solution, offers centralised transaction processing, monitoring, reporting and management of issues across multiple core banking systems for today's customer centric bank.

The B2 Payment Execution solution

B2 Group's PayEX provides banks with centralised processing for every payment transaction within the bank. PayEX integrates with existing bank architecture and coexists with existing systems including core banking applications.

PayEX is another of the powerful modules that comprise the B2 GTS suite of problem solving solutions for Banks and Corporates.

PayEX enhances the productivity of existing core banking systems and sits between the OMS (order management system) and the back-end core banking system. Banks will recognise that the reality is that their organisation is likely to have multiple core banking systems and the beauty of PayEX is that it performs just as well for customers in a single country, multi bank environment as for those large and complex multi-national clients operating across multiple geographic regions.

With PayEX banks can

- Collect payment instructions from any order management system, be they
 - Multiple ordering account or counterparty account transactions
 - Transfers, payments or collections
- Validate and if necessary enrich instructions from a central point according to company rules
- Automatically group instructions according to transaction type
- Automatically route instructions to multiple core banking systems by transaction type
- Accommodate the multiple formats and exchange protocols of every core banking system within the bank environment
- Access a granularity of transaction types within instructions, debits and credits
- Efficiently manage complex suspense account functionality

PayEX delivers benefits to the Bank in a variety of ways

Visibility for the monitoring, reporting and management of issues is now possible from a central point. No matter how complex the core banking environment may be, or indeed how complicated are the multi-faceted payment instruction messages.

There is no delay in achieving improved productivity and increased efficiency with PayEX.

This product replaces the need for risky, expensive and time consuming IT projects to be delivered by the already overloaded bank IT departments.

Already proven, PayEX integrates easily into existing architectures, works seamlessly with existing systems and it provides an important safety net. The product is not affected by changes to core banking systems or the upgrading of existing systems.

B2 PayEX – a truly innovative product for today's customer centric bank providing centralised payment visibility across multiple systems and geographies.

“ Whether a single or multi-bank environment, PayEX is a valuable tool for improving the efficiency and reliability of payment message processing.”
