

Payments Execution Across Multiple Countries and Core Banking Systems.

An African Transaction Bank operating in a number of countries required an integrated payments execution platform that would provide a single interface between the bank's Order Management System and its in-country core banking systems for the processing of payments and bank statements. Bulk processing was required for certain payment types, along with complex message workflow and processing logic for transactions using suspense accounts.

B2 rapidly configured GTS to meet the bank's specific needs (via a two month proof of concept project), after which roll-out of the solution to different countries commenced. The bank can now add new countries quickly and easily with minimal assistance from B2.

This project utilised the PayEX module running at the bank's data centres, interfacing the bank's Order Management System with three different third-party Core Banking Systems, currently running in eleven different countries.
